

Festool, Wendlingen (Germany) – June 2019

Press release for the technical press

Mobility to the power of three

The new Systainer³ from Festool

For an organised workplace and safe transportation of tools and accessories – from the workshop to the construction site. The new generation of Systainer offers maximum mobility and impresses with countless practical and smart functions. The new Systainer³ was developed by Festool and Tanos in cooperation with bott, the specialist in high-quality vehicle equipment, and therefore fits seamlessly into with the new bott vario3 vehicle equipment range.

One Systainer, thousands of possibilities: The versatility of the new Systainer³ from Festool redefines mobility at work, enabling maximum flexibility – from the workshop to the construction site. The new Systainer³ was developed by Festool and Tanos in cooperation with bott, the specialist in high-quality vehicle equipment. The common objective of the cooperation: To make everyday working life even easier for professional users. That's why all tools and consumables in the new Systainer³ can be perfectly integrated into the bott vario3 vehicle equipment range, remaining clearly organised while stowed and always within easy reach, whether in the workshop, on the move or at a construction site. At the same time, with the Systainer³ in combination with the bott vario3 vehicle equipment, which enables easy loading and unloading, you can be on the move much more quickly, saving you time and money.

Organised³

The new Systainer³ Organizer for neat and tidy storage of small parts is another new addition to the Systainer range. It is available in two different sizes and has a transparent cover so you can easily identify the contents. Festool offers a range of equipment for the Systainer³ Organizer, with a total of seven different sizes of small parts boxes. Practical: Systainer³ and the Systainer³ Organizer can be connected together, providing optimum organisation of the machine and consumables in the same system. With the established T-LOC one-handed operating element, both new products can easily dock onto another new product: The Systainer³ roll board. It comes with four handle options as well as practical feedthroughs for straps and, with its load-carrying capacity of up to 100 kg, is ideal for mobile use. The new Systainer³ can also be connected to other Festool system accessories, such as the mobile dust extractor.

Economical³

"The Systainer has always been more than just a toolbox. It's an important module in our Festool transport and storage system, which we are constantly expanding and further developing. But the new Systainer is significantly more versatile in terms of application areas," stresses Oliver Seeger, Product Manager for Systainer at Festool. "With the help of the T-LOC operating element, the Systainer³ and many other system products – including the older Systainer generations – can be connected together. In addition, thanks to integrated mounting rails, it can now fit seamlessly into the new bott vario³ vehicle equipment. This not only means you save a lot of time on your journey from the workshop to the construction site and back, but you are also safe when you are travelling, as no unsecured items can fly around. Everything stays in its place, even in the event of an accident. Safety is the top priority for all of our products."

Mobility³

The superscript number "3" not only indicates the third generation of the Systainer, which has been established in the professional trade sector since

1993, but also the three application areas: Workshop, transport and construction site. With the standardised Systainer³ storage and transport system, everything can be stored neatly, perfectly organised and securely stowed, both in the stationary workshop and on the construction site. The new Systainer³ is also fully downwards-compatible with all older Systainer models. In addition, the Systainer³ system is available in a range of widths and heights. The three low Systainer³ variants have a handy front carrying handle, allowing them to be carried ergonomically, close to the body. The new Systainer³ can be connected to other Festool system accessories, such as the new Systainer³ roll board or the mobile dust extractor.

The new Systainer³, Systainer³ Organizer and Systainer³ roll board will be available from specialist retailers from January 2020.
